

Blake G. Crowther, Ph.D.

Professional Experience

2014-Present	Principal Engineer, Synopsys, Inc., Optical Solutions Group
2012-Present	Associate Research Professor, Utah State University, Electrical and Computer Engineering
2005-2014	Senior Optical Scientist, Space Dynamics Laboratory
2005-2012	Adjunct Assistant Professor, Utah State University, Electrical and Computer Engineering
2002-2005	Engineer IV, Space Dynamics Laboratory
2000-2002	Senior Systems Engineer, Optical Research Associates
1998-2000	Senior Engineer, Space Dynamics Laboratory
1998-2001	Adjunct Assistant Professor, Utah State University, Electrical and Computer Engineering
1997-1998	Member Technical Staff II, Hughes Missile Systems Company
1997-Present	Adjunct Assistant Research Scientist, University of Arizona, College of Optical Sciences
1992-1997	Research Associate, University of Arizona, College of Optical Sciences

Education

1997	Ph.D. Degree in Optical Sciences, University of Arizona, College of Optical Sciences
1994	M.S. Degree in Optical Sciences, University of Arizona, College of Optical Sciences
1992	M.S. Degree in Agricultural and Irrigation Engineering, Utah State University
1990	B.S. Degree in Electrical Engineering, Utah State University
1990	B.A. Degree in Physics, Utah State University

Dr. Crowther has designed, tested, and led teams to build several types of optical and electro-optical instruments. These include CCD- and CMOS-based cameras for space missions lasting from one to more than ten years of operation. He has designed and led the optical design, system build, and test of several infrared instruments. Some major missions that have flown, are currently flying, or will fly optical designs or instruments on which Dr. Crowther has worked include TES (AURA for NASA), SABER (TIMED for NASA), SOFIE (AIM for NASA), WISE (WISE for NASA), OCAMS (OSIRIS-REx for NASA), and MIGHTI and FUV (ICON for NASA). These instruments range from the ultra-violet, to the visible, to the far infrared portions of the electromagnetic spectrum. He has also performed research for future optical instruments to include ultra-stable laser-based calibration sources, fiber-based interferometric sensors to detect gravitational waves, and deployable optics. Ground-based optical designs and instrument designs on which Dr. Crowther have worked include cryogenic infrared radiometers and Michelson interferometers. He has also designed and worked on lidar systems including tunable DIAL (1.5 – 1.7 μm) and three color Nd:YAG (355, 532, and 1064 nm) systems.

Dr. Crowther has experience designing unique all-reflective off-axis systems and refractive systems such as super-achromats for spectrometry applications. He has designed novel hyperspectral and polarimetric imaging systems. He has designed multiple low-cost optical systems for cameras, fluorescence imagers, and bar-code readers some of which use plastic injection molded elements that have been produced in quantities greater than 100,000. He has designed optical systems for assessing human dermatological health, as well as flexible and rigid endoscopes.

His professional experience also includes designs for extreme ultra-violet lithography fly's eye illuminators. He has designed and performed analysis on shearing interferometers and grating-based monochromator systems for the lithography industry as well.

In addition, Dr. Crowther has taught graduate-level optics courses. He has also mentored several students in obtaining Ph.D. and M.S. degrees in optical sciences, electrical and computer engineering, and physics.
